

ABSTRACT OF THE DISCLOSURE

Systems, methods and computer program products for routing notifications to wireless devices. Notifications are routed over a high capacity channel instead of a low capacity channel when the wireless device has access to the high capacity channel. The wireless device notifies a notification server when the wireless device has access to a high capacity channel and notifications are routed over the high capacity channel. When access to the high capacity channel is lost, the notification server resumes transmitting the notifications over the low capacity channel.
